Sequence 13142, Application US/09814353A

GENERAL INFORMATION:
APPLICANT: Let, John
APPLICANT: Lillie, James
TITLE OF INVENTION: NOVEL GENES, COMPOSITIONS, KITS, AND METHODS FOR
TITLE OF INVENTION: IDENTIFICATION, ASSESSMENT, PREVENTION, AND
TITLE OF INVENTION: THERAPY OF OVARIAN CANCER
FILE REFERENCE: MRI-006B

CURRENT PELING DATE: 2001-03-21

Library Construction (Standard Protocol): All procedures
discussed in this section have been described in detail
elsewhere (Soares et al., 1994; Bonaldo et al., 1996;
Jiang et al., 2001). Total cellular RNA from each sample
was isolated by using STAT-60 reagent (Tel-Test,
Friendswood, TX) and poly(A) + RNA was obtained by two
rounds of purification with the Oligotex mRNA isolation
kit (Qiagen) according to the manufacturer's instructions.
The oviduct libraries and the Day 3, 6 and 10 endometrium
libraries were constructed essentially as described by the
manufacturer's instructions provided with the SuperScript
Plasmid System (Invitrogen, cat. no. 18248-013). Briefly,
Img of poly(A) + RNA will be annealed at 37 degrees Celsius with SuperScript
Plasmid System (Invitrogen, cat. no. 18248-013). Briefly,
Img of poly(A) + RNA will be annealed at 37 degrees (Jiang et al., 2001). The 'tag' represents a
transcriptuse (Jiang et al., 2001). The 'tag' represents a
tissue/stage-specific ten-base sequence identifier
(http://genome.ulowa.edu/pubsoft/software.html) present in
the oligonuclectide used to prime first-strand synthesis.
Second strand synthesis was performed with 74 bNA
polymerase in the presence of DNA ligase and RNase H.
After second strand synthesis, the double-stranded cDNAs
was ligated to Sall adapters (Invitrogen-Life
Technologies) and digested with NotI. The cDNAs will be
size selected by passage through cDNA size fractionation
columns (Invitrogen-Life technologies) The cDNAs exived
from each developmental steage of a particular tissue were
mixed on an equimolar basis and ligated directionally into
the NotI and Sall sites of the possage the prosents. the plasmids
                                                                                                                                                                                                                                                                                                               Kim, J., Whitworth, K.M., Springer, G.K., Bivens, N.J., Ries, J.E.,

will be electroporated into DH10B bacteria. The day 12-14 endometrium library was synthesized by Dr. Bento Soares' laboractory (University of Iowa) and was cloned into the T3T7pac vector as described elsewhere (Bonaldo et al., 1996). Preliminary Library Characterization: Randomly chosen clones from each library were analyzed by restriction digestion to determine average insert size (96 clones) and by sequencing (-4 96 well plates) to confirm library quality [e.g. the presence of short polyA+ tails, genomic DNA contamination (must be <1%), ribosomal RNA clones (must be <1%), etc.] and to provide a sequence database representing the predominant clones in each library. The clones were sequenced at the University of Missouri-Columbia DNA Core Facility. Bioinformatics work was performed by GK Springer's bioinformatics group (WG Spollen, JE Ries, A Guillen, AA Khambati, RV Patel, CM Topinka, SB Bhuiyan) in Computer Science and Health Management and Informatics Departments at the University of Missouri-Columbia. Clone Requests: Requests for clones should be made to the Director of the University of Missouri DNA Core facility at: porcine@rnet.missouri.edu. Citations: 1. Bonaldo MF, Lennon G, Soares MB.

Sequencial rearrant series of the pubsoft/software. html) present in the oligonucleotide used to prime first-strand synthesis. Second strand synthesis was performed with T4 DNA polymerase in the presence of DNA ligase and RNAse H. After second strand synthesis, the double-stranded cDNAs was ligated to Sall adapters (Invitrogen-Life columns (Invitrogen-Life technologies). The cDNAs will be size selected by passage through cDNA size fractionation columns (Invitrogen-Life technologies). The cDNAs derived from each developmental stage of a particular tissue were mixed on an equimolar basis and ligated directionally into the NotI and Sall sites of the pSPORTI vector. (Invitrogen). After ligation of the inserts, the plasmids will be electroporated into DHAOB bacteria. Preliminary Library were analyzed by restriction digestion to determine average insert size (96 clones) and by sequencing (~4 96-well plates) to confirm library quality [e.g. the presence of short poly4+ tails, genomic DNA confamination (must be cl$), ribosomal RNA clones (must be cl$), etc.] and to provide a sequence database representing the predominant clones in each library. The clones were sequenced at the University of Missouri-Columbia DNA Core Facility, Bioinformatics work was performed by GK Springer's bioinformatics group (WG Spollen, JB Ries, A Guillen, AA Khambati, RV Patel, CM Topinka, SB Bhuiyan) in Computer Science and Health Management and Informatics Departments at the University of Missouri-Columbia. Clone Requests: Requests for clones should be made to the Director of the University of Missouri-Columbia. Clone Requests: Requests for clones should be made to the Director of the University of Missouri-Columbia. In Bonaldo MF Lennon G, Soares MB.

/clone ovary, dissected follicles, or corpora lutea) was collected from crossbred pigs (Suss scrofa domestica), frozen in liquid nitrogen shortly after collection, and stored at -80 degrees Celsius until RNA extraction. The tissue from several individual pigs was pooled for the purpose of RNA extraction. The specific tissues collected were fetal whole ovary; neonatal whole ovary; prepubutal whole ovary; 2, 4, 6 and 8 mm growing follicles; Day 0 follicles; Day 5 small antral follicles and corpora lutea; Day 12 corpora lutea and Day 12
/collicles. More information regarding the methods can be

Library Construction (Standard Protocol): All procedures
discussed in this section have been described in detail
elsewhere (Soares et al., 1994; Bonaldo et al., 1996;
Jiang et al., 2001). Total cellular RNA from each sample
was isolated by using STAT-60 reagent (Tel-Test,
Friendswood, TX) and the poly(A)+ RNA was obtained by two
rounds of purification with the Oligotex mRNA isolation
kit (Qiagen) according to the manufacturer's instructions provided with the
SuperScript Plasmid System (Invitrogen, cat. no.
18240-013). Britefly, 1mg of poly(A)+ RNA will be annealed
at 37 degrees Celsius with 10mg of NotI-tag-dil8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              oligonucleotide (GCTGCTGGGGGCGC-tag-T18) and reverse transcribed at 37 degrees Celsius with SuperScript II (Invitrogen) reverse transcriptase (Jiang et al., 2001). The 'tag' represents a tissue/stage-specific ten-base sequence identifier

/note="Vector: psport; Funding: A grant from the Monsanto Company to the University of Missouri. Genetic Source: Ovarian tissue (whole ovary, dissected follicles, or corpora lutea) was collected from crossbred pigs (Sus scrofa domestica), frozen in liquid nitrogen shortly after collection, and stored at -80 degrees Celsius until RNA extraction. The tissue from several individual pigs was pooled for the purpose of RNA extraction. The specific tissues collected were fetal whole ovary; neonatal whole
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Jiang H., Whitworth, K.M., Bivens, N.J., Ries, J.E., Woods, R.J., Forrester, L.J., Springer, G.K., Mathialagan, N., Agca, C., Prather, R.S. and Lucy, M.C.

Sequence localization (http://genome.uiowa.edu/pubsoft/software.html) present in the oligomucleotide used to prime first-strand synthesis. Second strand synthesis was performed with T4 DNA polymerase in the presence of DNA ligase and RNase H. After second strand synthesis, the double-stranded CDNAs was ligated to SalI adapters (Invitrogen-Life Echnologies). The CDNAs wail) be size selected by passage through CDNA size fractionation columns (Invitrogen-Life technologies). The CDNAs wail be size selected by passage through CDNA size fractionation columns (Invitrogen-Life technologies). The CDNAs will be size selected by passage through cDNA size fractionation columns (Invitrogen-Life technologies). The CDNAs will be size selected by passage through cDNA size fractionally into the NotI and SalI sites of the pSPORTI vector

(Invitrogen). After ligation of the inserts, the plasmids will be electroporated into DH10B bacteria. Preliminary Library were analyzed by restriction digestion to determine average insert size (96 clones) and by sequencing (~4 96-well plates) to confirm library quality [e.g. the presence of short poly4+ tails, genomic DNA contamination (must be <1%), ribosomal RNA clones (must be <1%) etc.] and to provide a sequence database representing the predominant clones in each library. The clones were sequenced at the University of Missouri-Columbia DNA Core Facility. Bioinformatics group (WG Spollen, JR Ries, A Guillen, AA Khambati, RV Patel, CM Topinka, SB Bhuiyan) in Computer Science and Health Management and Informatics Departments at the University of Missouri-Columbia. Clone Requests: Requests for clones should be made to the Director of the University of Missouri-Columbia. Clone Requests: Requests for clones should be made to the Director of the University of Missouri-Columbia. Clones Requests: Requests for clones with fewers. Boringer GK, Didion BA, Mathialagan N, Ries JB, Whittworth KM, Green JA, Forrester LJ, Springer GK, Didion BA, Mathialagan N, Ries Park Missouri DNA CORE dacillate and Park
Jiang et al., 2001). Total cellular RNA from each sample was isolated by using STAT-60 reagent (Tel-Test, Friendswood, TX) and the poly(A)+ RNA was obtained by two rounds of purification with the Oligotex mRNA isolation kit (Qiagen) according to the manufactures' sinstructions. The libraries were constructed essentially as described by the manufacturer's instructions provided with the SuperScript Plasmid System (Invitrogen, cat. no. 18148-013). Briefly, Img of poly(A)+ RNA will be annealed at 37 degrees Calsius with 10mg of NorI-tag-dT18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        transcribed at 37 degrees Celsius with SuperScript II (Invitrogen) reverse transcriptase (diang et al., 2001). The 'tag' represents a tissue/stage-specific ten-base sequence identifier
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Construction and characterization of a normalized cDNA library. /note="DNA wase sextracted from Arabidopsis thaliana whole plant tissue, provided by members of Rob Martienssen's lab, using TRIZOL. Primers were designed in Hypothetical genes and un-annotated regions in Arabidopsis that are conserved in Brassica oleracea located in the short arm of chromosome 4. PCR products were either cloned into pCR chromosome 4. PCR products were either cloned into pCR TOPO 2.1 vector (Invitrogen) and then sequenced using -21 M13 forward and reverse universal primers or treated with Exonuclease 1 and Shrimp Alkaline phosphatase and sequenced using the specific primers."

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             * NOTE: This is a 'working draft' sequence. It currently consists of 12 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gap of 100 bp
